

## Windows installation:

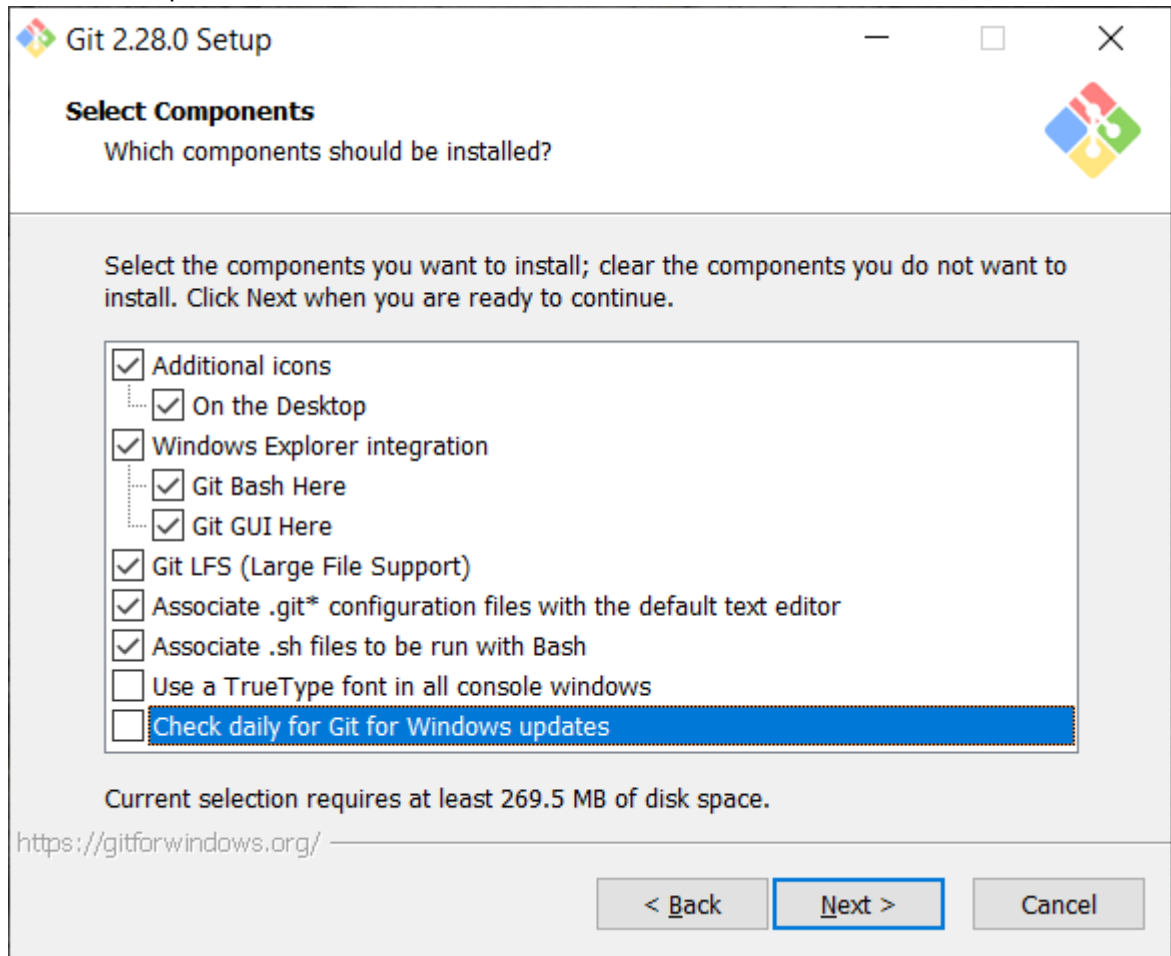

- 1) Download the installer file from <https://git-scm.com/downloads>
- 2) Open the installer and click next

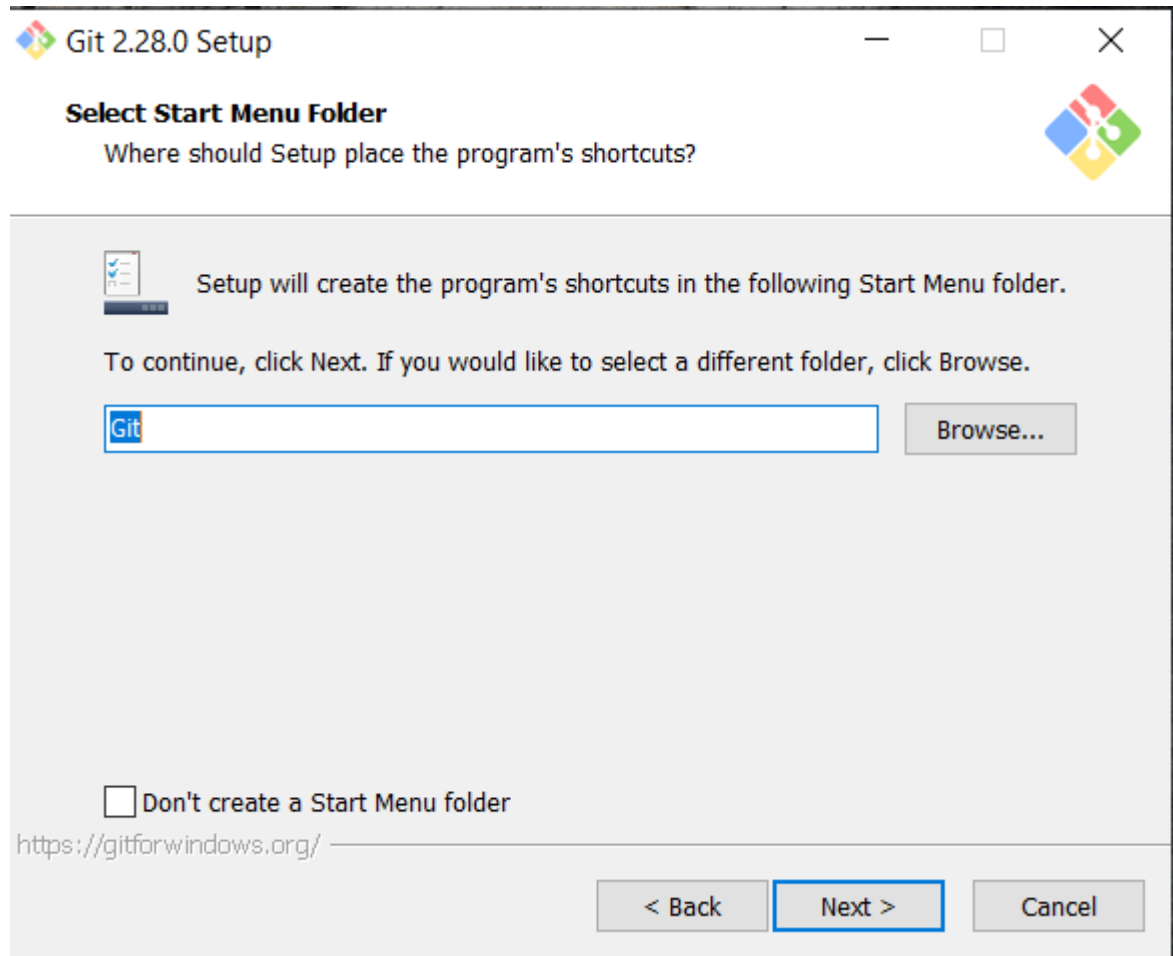

- 3) Choose the directory where you want to install git bash and click next

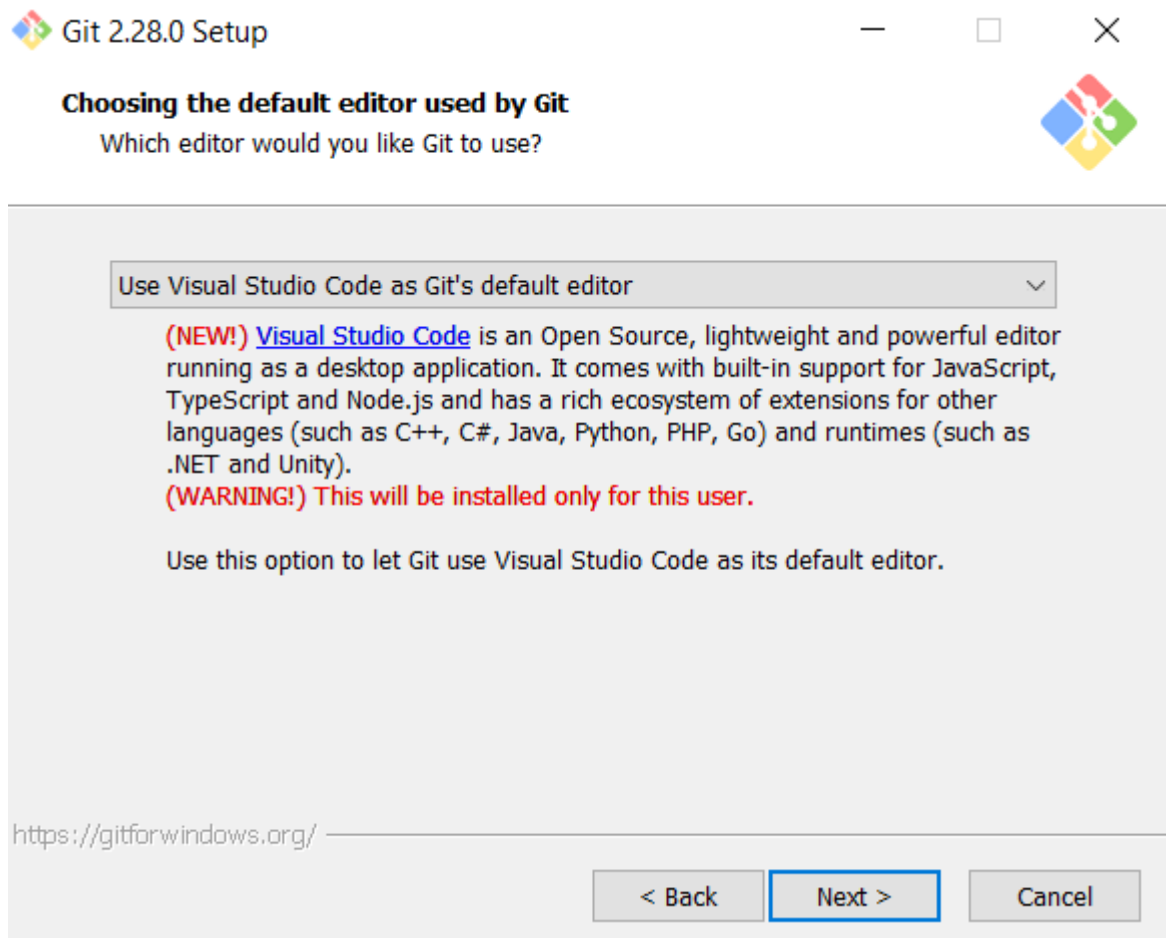

4) Choose this options and click next

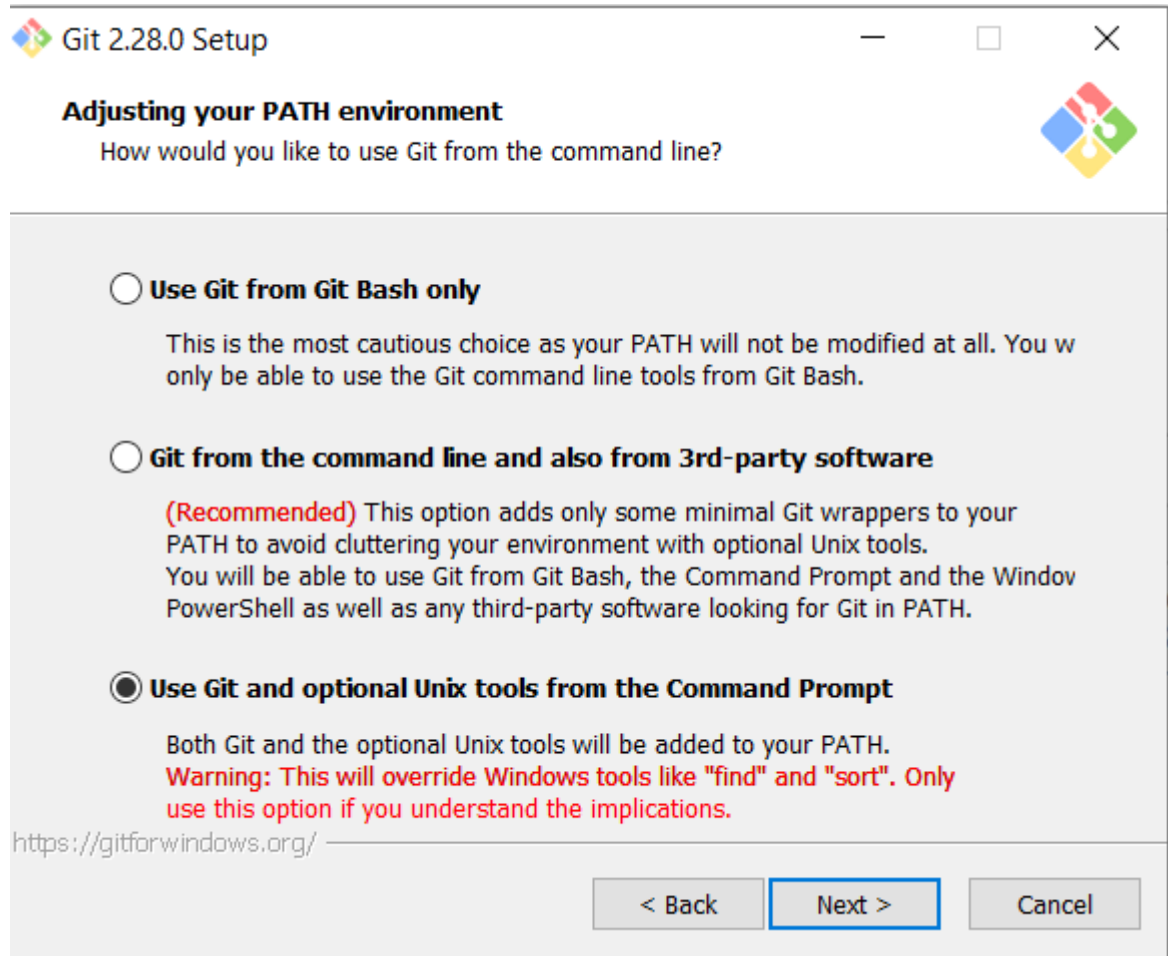

5) Click next

- 6) Choose the text editor which you are using and click next

7) Choose either 2<sup>nd</sup> or 3<sup>rd</sup> option and click next

The image shows the 'Git 2.28.0 Setup' window. The title bar includes the Git logo, the text 'Git 2.28.0 Setup', and standard window controls (minimize, maximize, close). The main content area is titled 'Adjusting your PATH environment' and asks 'How would you like to use Git from the command line?'. There are three radio button options. The first option is 'Use Git from Git Bash only'. The second option is 'Git from the command line and also from 3rd-party software', which is marked as '(Recommended)'. The third option is 'Use Git and optional Unix tools from the Command Prompt', which is selected. At the bottom, there is a URL 'https://gitforwindows.org/' and three buttons: '< Back', 'Next >', and 'Cancel'.

**Git 2.28.0 Setup**

**Adjusting your PATH environment**  
How would you like to use Git from the command line?

☐ **Use Git from Git Bash only**  
This is the most cautious choice as your PATH will not be modified at all. You will only be able to use the Git command line tools from Git Bash.

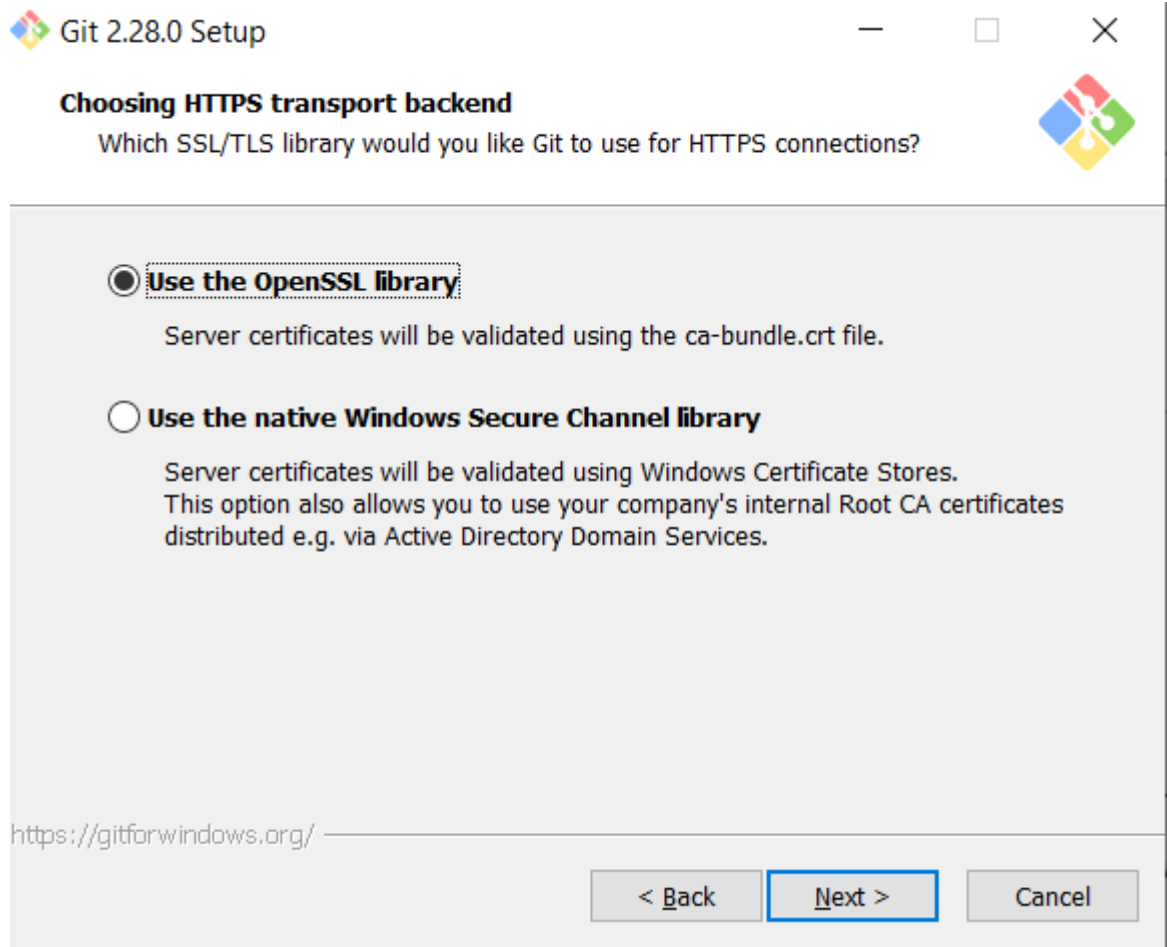

☐ **Git from the command line and also from 3rd-party software**  
**(Recommended)** This option adds only some minimal Git wrappers to your PATH to avoid cluttering your environment with optional Unix tools. You will be able to use Git from Git Bash, the Command Prompt and the Windows PowerShell as well as any third-party software looking for Git in PATH.

☒ **Use Git and optional Unix tools from the Command Prompt**  
Both Git and the optional Unix tools will be added to your PATH.  
**Warning: This will override Windows tools like "find" and "sort". Only use this option if you understand the implications.**

The image shows a Windows installer window titled "Git 2.28.0 Setup". The window has a standard Windows title bar with minimize, maximize, and close buttons. The main content area is titled "Choose the default behavior of `git pull`" and asks "What should `git pull` do by default?". There are three radio button options: "Default (fast-forward or merge)" (selected), "Rebase", and "Only ever fast-forward". Each option has a descriptive text block below it. At the bottom, there is a URL "https://gitforwindows.org/" and three buttons: "< Back", "Next >" (highlighted with a blue border), and "Cancel".

**Git 2.28.0 Setup**

**Choose the default behavior of `git pull`**  
What should `git pull` do by default?

☒ **Default (fast-forward or merge)**  
This is the standard behavior of `git pull` : fast-forward the current branch to the fetched branch when possible, otherwise create a merge commit.

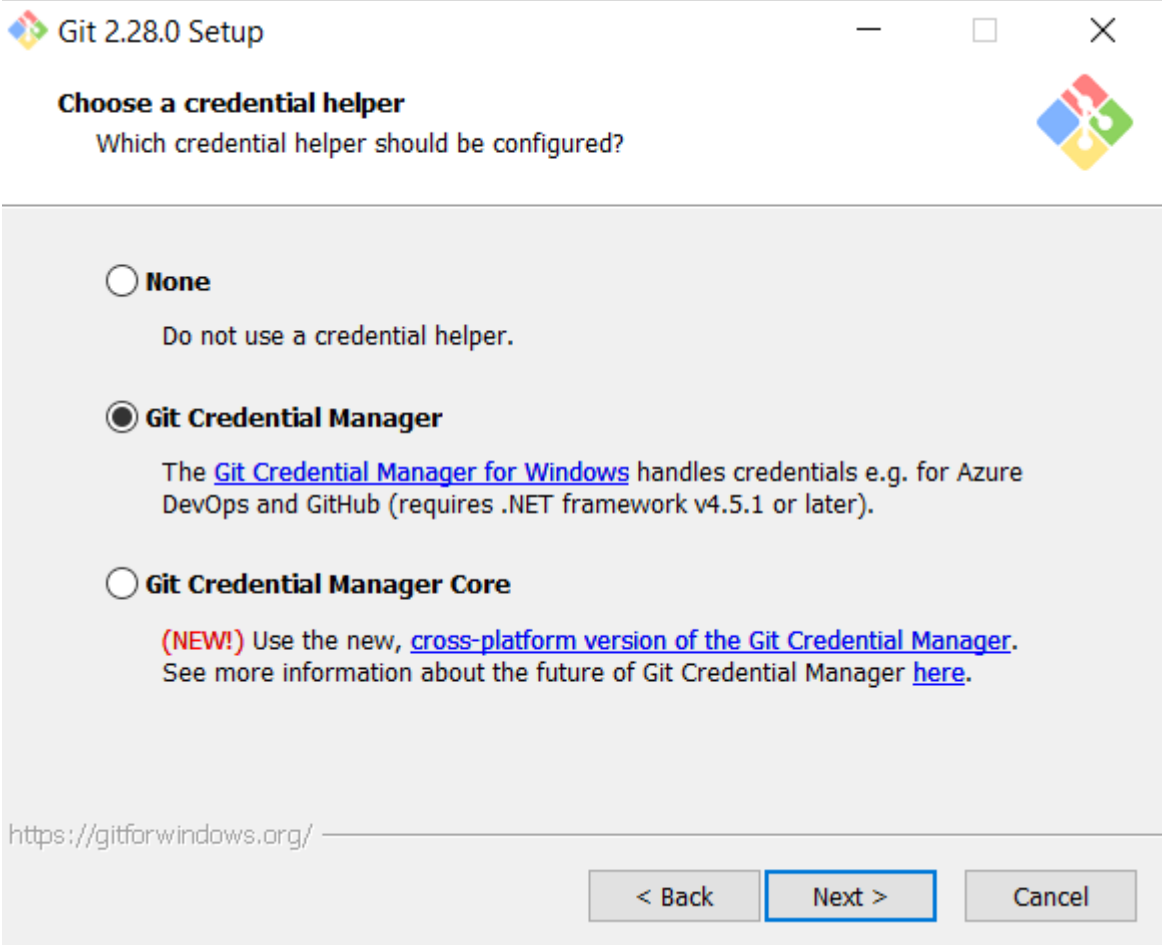

☐ **Rebase**  
Rebase the current branch onto the fetched branch. If there are no local commits to rebase, this is equivalent to a fast-forward.

☐ **Only ever fast-forward**  
Fast-forward to the fetched branch. Fail if that is not possible.

The image shows a Windows installer window titled "Git 2.28.0 Setup". The window has a standard title bar with minimize, maximize, and close buttons. The main content area is titled "Choose a credential helper" and asks "Which credential helper should be configured?". There are three radio button options: "None", "Git Credential Manager" (which is selected), and "Git Credential Manager Core". Each option has a brief description. At the bottom, there is a URL "https://gitforwindows.org/" and three buttons: "< Back", "Next >" (which is highlighted with a blue border), and "Cancel".

**Git 2.28.0 Setup**

**Choose a credential helper**  
Which credential helper should be configured?

☐ **None**  
Do not use a credential helper.

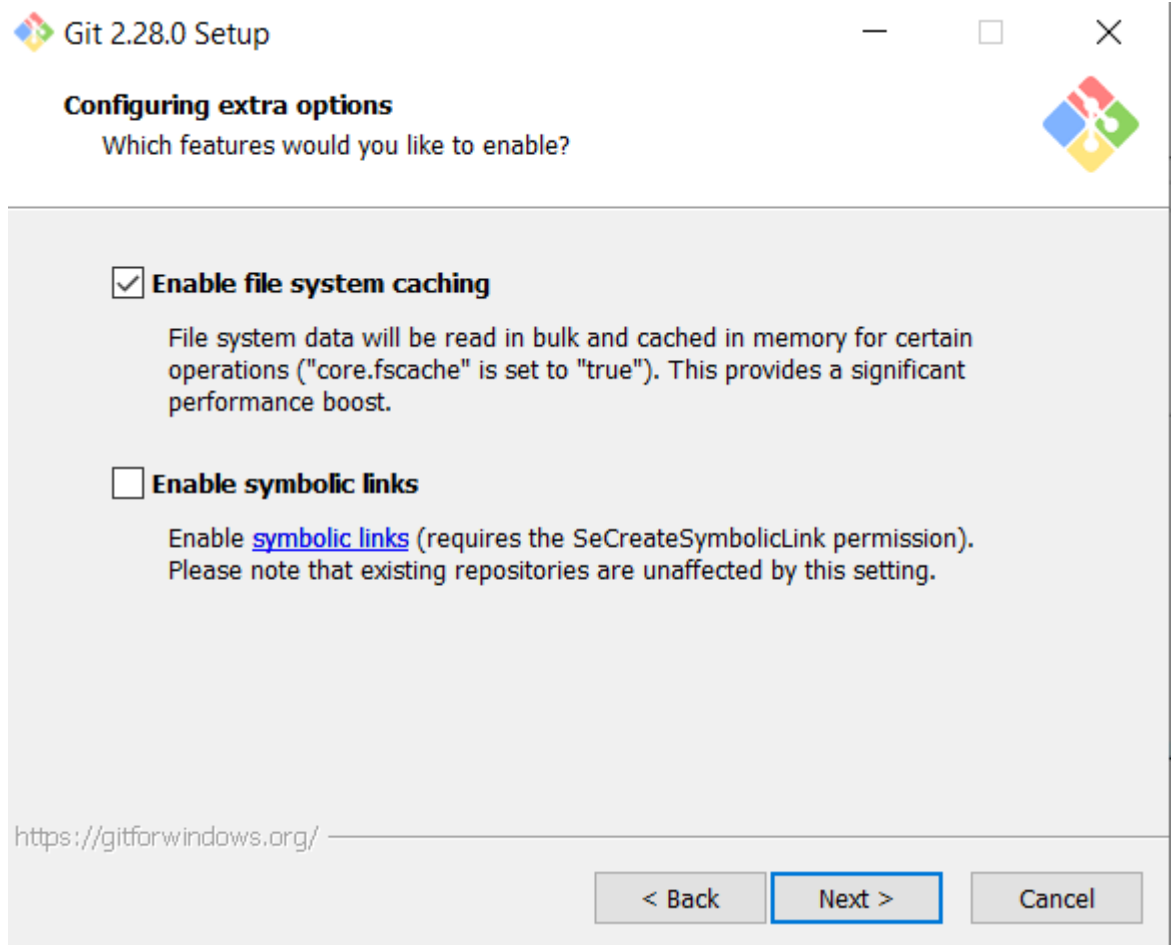

☒ **Git Credential Manager**  
The [Git Credential Manager for Windows](#) handles credentials e.g. for Azure DevOps and GitHub (requires .NET framework v4.5.1 or later).

☐ **Git Credential Manager Core**  
(NEW!) Use the new, [cross-platform version of the Git Credential Manager](#).  
See more information about the future of Git Credential Manager [here](#).

## Linux Installation :

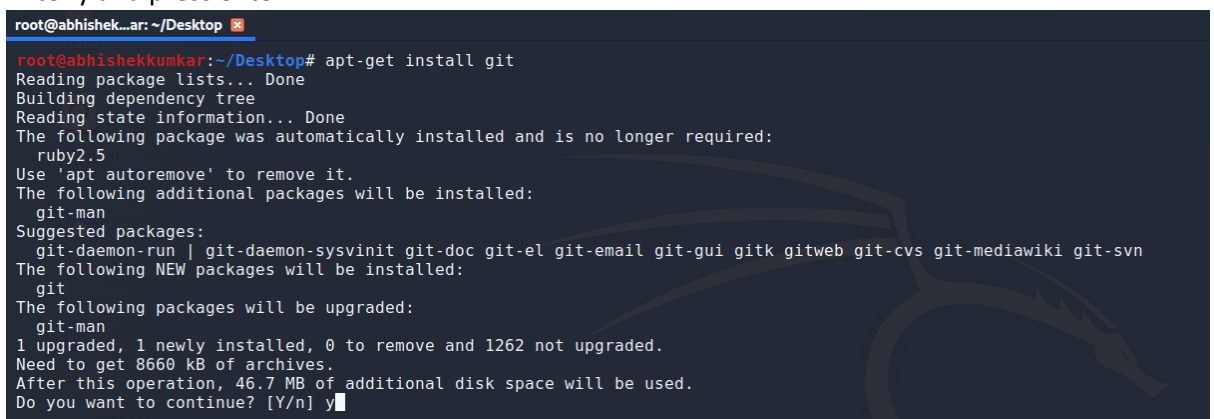

- 1) Go to desktop and right click

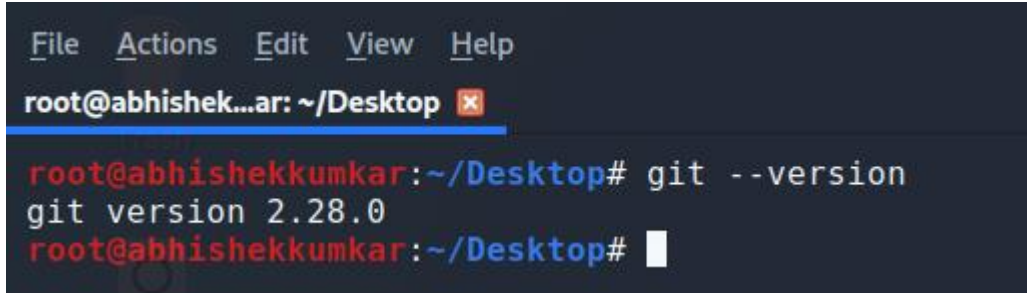

- 2) Click on Open Terminal Here and type and press enter: apt-get install git

- 3) Enter y and press enter

- 4) Type and press enter : `git --version`

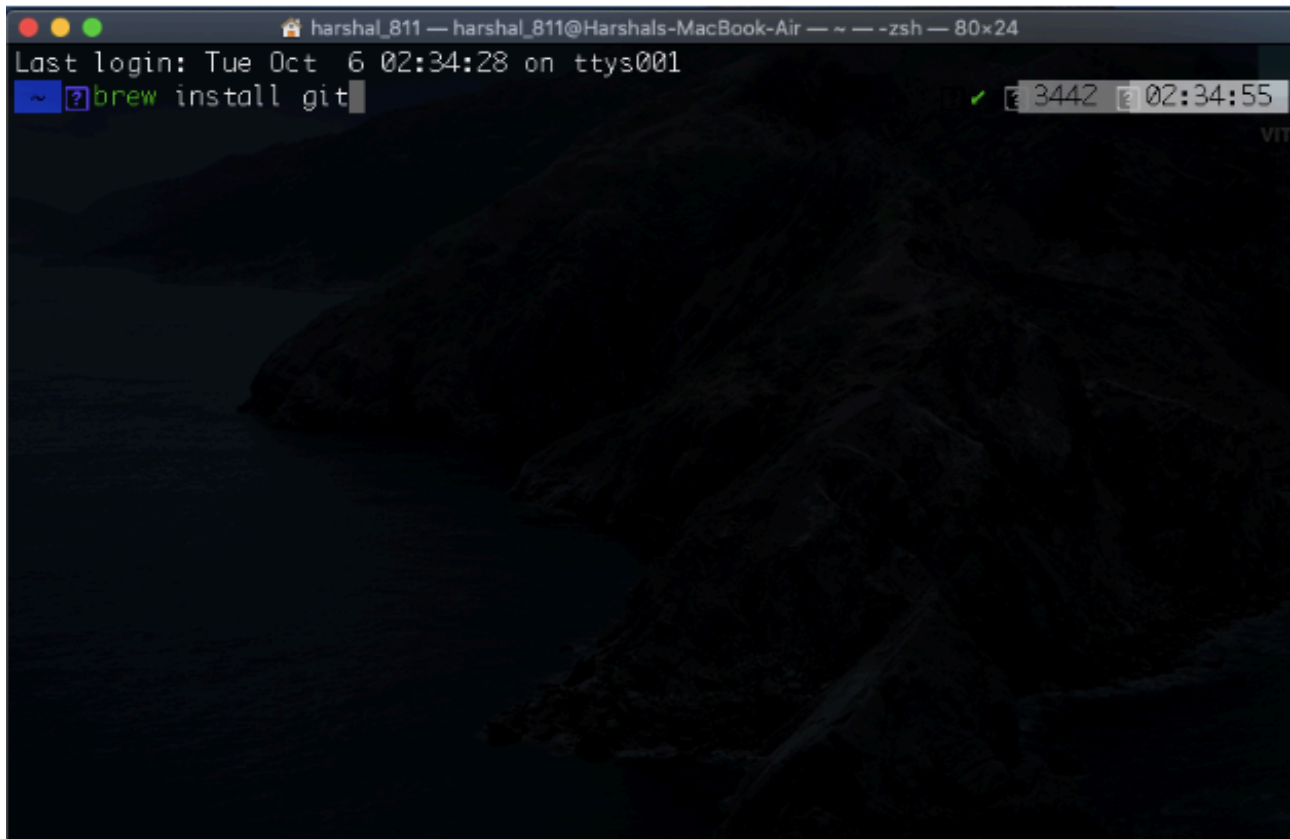

A screenshot of a terminal window with a dark background. At the top, there is a menu bar with the items 'File', 'Actions', 'Edit', 'View', and 'Help'. Below the menu bar, the terminal title bar shows 'root@abhishek...ar: ~/Desktop' followed by a red close button icon. The terminal content shows a prompt 'root@abhishekkumkar:~/Desktop#' in red and blue text, followed by the command 'git --version' in white. The output 'git version 2.28.0' is displayed in white on the next line. A second prompt 'root@abhishekkumkar:~/Desktop#' is shown at the bottom with a white cursor block.

- 5) Successfully installed git

## Git Installation on MacOS

1. Open your terminal and enter the following command: **brew install git**

A screenshot of a macOS terminal window. The title bar at the top shows the user 'harshal\_811' and the machine 'harshal\_811@Harshals-MacBook-Air'. The terminal text shows 'Last login: Tue Oct 6 02:34:28 on ttys001' followed by a prompt '~' and the command 'brew install git' entered in green text. The background of the terminal is a dark, scenic image of a coastline with mountains and water. In the top right corner of the terminal window, there is a status bar showing a green checkmark, a battery icon, the number '3442', and the time '02:34:55'.

**NOTE:** The command won't work if HomeBrew is not installed on your laptop. So make sure to install HomeBrew as well.

It can be installed in just one command. Refer <https://brew.sh/>
